THROMBOPOIETIN MIMETICS

FIELD OF THE INVENTION

This invention relates to thrombopoietin (TPO) mimetics and their use as
5 promoters of thrombopoiesis and megakaryocytopoiesis.

BACKGROUND OF THE INVENTION

Megakaryocytes are bone marrow-derived cells, which are responsible for
producing circulating blood platelets. Although comprising <0.25% of the bone marrow
10 cells in most species, they have >10 times the volume of typical marrow cells. See Kuter et
al. Proc. Natl. Acad. Sci. USA 91: 11104-11108 (1994). Megakaryocytes undergo a
process known as endomitosis whereby they replicate their nuclei but fail to undergo cell
division and thereby give rise to polyploid cells. In response to a decreased platelet count,
the endomitotic rate increases, higher ploidy megakaryocytes are formed, and the number
15 of megakaryocytes may increase up to 3-fold. See Harker J. Clin. Invest. 47: 458-465
(1968). In contrast, in response to an elevated platelet count, the endomitotic rate
decreases, lower ploidy megakaryocytes are formed, and the number of megakaryocytes
may decrease by 50%.

The exact physiological feedback mechanism by which the mass of circulating platelets
20 regulates the endomitotic rate and number of bone marrow megakaryocytes is not known. The
circulating thrombopoietic factor involved in mediating this feedback loop is now thought to be
thrombopoietin (TPO). More specifically, TPO has been shown to be the main humoral
regulator in situations involving thrombocytopenia. See, e.g., Metcalf Nature 369:519-520
(1994). TPO has been shown in several studies to increase platelet counts, increase platelet size,
25 and increase isotope incorporation into platelets of recipient animals. Specifically, TPO is
thought to affect megakaryocytopoiesis in several ways: (1) it produces increases in
megakaryocyte size and number; (2) it produces an increase in DNA content, in the form of
polyploidy, in megakaryocytes; (3) it increases megakaryocyte endomitosis; (4) it produces
increased maturation of megakaryocytes; and (5) it produces an increase in the percentage of
30 precursor cells, in the form of small acetylcholinesterase-positive cells, in the bone marrow.

Because platelets (thrombocytes) are necessary for blood clotting and when their
numbers are very low a patient is at risk of death from catastrophic hemorrhage, TPO has
potential useful application in both the diagnosis and the treatment of various
hematological disorders, for example, diseases primarily due to platelet defects (see Harker
35 et al. Blood 91: 4427-4433 (1998)). Ongoing clinical trials with TPO have indicated that
TPO can be administered safely to patients (see Bassier et al. Blood 89: 3118-3128 (1997);
Fanucchi et al. New Engl. J. Med. 336: 404-409 (1997)). In addition, recent studies have

provided a basis for the projection of efficacy of TPO therapy in the treatment of thrombocytopenia, and particularly thrombocytopenia resulting from chemotherapy, radiation therapy, or bone marrow transplantation as treatment for cancer or lymphoma. (See Harker, Curr. Opin. Hematol. 6: 127-134 (1999)).

5 The gene encoding TPO has been cloned and characterized. See Kuter et al., Proc. Natl. Acad. Sci. USA 91: 11104-11108 (1994); Barley et al., Cell 77: 1117-1124 (1994); Kaushansky et al., Nature 369:568-571 (1994); Wendling et al., Nature 369: 571-574 (1994); and Sauvage et al., Nature 369: 533-538 (1994).

10 Thrombopoietin is a glycoprotein with at least two forms, with apparent molecular masses of 25 kDa and 31 kDa, with a common N-terminal amino acid; sequence. See, Baatout, Haemostasis 27: 1-8 (1997); Kaushansky, New Engl. J. Med. 339: 746-754 (1998).

15 Thrombopoietin appears to have two distinct regions separated by a potential Arg-Arg cleavage site. The amino-terminal region is highly conserved in man and mouse, and has some homology with erythropoietin and interferon-a and interferon-b. The carboxy-terminal region shows wide species divergence.

20 The DNA sequences and encoded peptide sequences for human TPO receptor (TPO-R; also known as c-mpl) have been described. (See, Vigon et al. Proc. Natl. Acad. Sci. USA 89: 5640-5644 (1992)). TPO-R is a member of the haematopoietin growth factor receptor family, a family characterized by a common structural design of the extracellular domain, including for conserved C residues in the N-terminal portion and a WSXWS motif close to the transmembrane region. (See Bazan Proc. Natl. Acad. Sci. USA 87: 6934-6938 (1990)). Evidence that this receptor plays a functional role in hematopoiesis includes observations that its expression is restricted to spleen, bone marrow, or fetal liver in mice (see Souyri et al. Cell 63: 1137-1147 (1990)) and to megakaryocytes, platelets, and CD34⁺ cells in humans (see Methia et al. Blood 82: 1395-1401 (1993)). Further evidence for TPO-R as a key regulator of megakaryopoiesis is the fact that exposure of CD34⁺ cells to synthetic oligonucleotides antisense to TPO-R RNA significantly inhibits the appearance of megakaryocyte colonies without affecting erythroid or myeloid colony formation. Some workers postulate that the receptor functions as a homodimer, similar to the situation with the receptors for G-CSF and erythropoietin. (see Alexander et al. EMBO J. 14: 5569-5578 (1995)).

35 The slow recovery of platelet levels in patients suffering from thrombocytopenia is a serious problem, and has lent urgency to the search for a blood growth factor agonist able to accelerate platelet regeneration (see Kuter, Seminars in Hematology, 37: Supp 4: 41-49 (2000)).

It would be desirable to provide compounds which allow for the treatment of thrombocytopenia by acting as a TPO mimetic.

As disclosed herein it has unexpectedly been discovered that certain hydroxy-1-azo-benzene derivatives are effective as agonists of the TPO receptor, they are potent TPO mimetics.

Scheme I outlines the formation of Formula I compounds. As used in scheme I, a 3-bromophenol (a) is nitrated with nitric acid or sodium nitrate and sulfuric acid to give nitro phenol (b). Coupling of (b) with a substituted arylboronic acid, such as 3-carboxyphenylboronic acid or 4-carboxyphenylboronic acid in the presence of a catalyst, preferably tetrakis(triphenylphosphino) palladium and a base such as sodium carbonate or triethylamine in a suitable solvent such as aqueous 1,4-dioxane or dimethylformamide afforded substituted aryl compound (c). Reduction of the nitro group by catalytic hydrogenation or mediated by a reducing metal such as iron or tin dichloride in a suitable solvent such as ethanol, acetic acid or water gives the aniline (d). Compound (d) is diazotized by reaction with sodium nitrite and an appropriate acid, such as nitric acid,

- sulfuric acid or, preferably, hydrochloric acid, in an appropriate aqueous solvent, such as water or, preferably an ethanol-water mixture to produce a diazonium species which is directly converted to compound (e) in a coupling reaction with an appropriate aryl species in the presence of a base, preferably sodium hydrogen carbonate, or an acid, preferably
- 5 hydrochloric acid.

Scheme II outlines an alternative synthesis of Formula I compounds. A 2-bromophenol (f) (such as 2-bromophenol or 2-bromo-5-methylphenol) is nitrated with nitric acid or sodium nitrate and sulfuric acid, to give nitro compound (g). The phenol (g) is then protected by reaction with an alkylating agent such as benzyl bromide or preferably methyl iodide in the presence of a base such as sodium hydride or potassium carbonate in a suitable solvent such as dimethylformamide, tetrahydrofuran or acetone to give protected nitrophenol (h) (Prot = alkyl or substituted alkyl, e.g. methyl, benzyl). Coupling of (h) with a substituted arylboronic acid, such as 3-carboxyphenylboronic acid or 4-carboxyphenylboronic acid, in the presence of a catalyst, preferably tetrakis(triphenylphosphino) palladium and a base such as sodium carbonate or triethylamine in a suitable solvent such as aqueous 1,4-dioxane or dimethylformamide afforded substituted aryl compound (i). Removal of the protecting group (Prot) is accomplished using a protic or Lewis acid; such as concentrated hydrobromic acid, boron tribromide or trimethylsilyl iodide to afford the phenol (j). Reduction of the nitro group by catalytic hydrogenation or mediated by a reducing metal such as iron or tin dichloride in a suitable solvent such as ethanol, acetic acid; or water gives the aniline (k). Compound (k) is diazotized by reaction with sodium nitrite and an appropriate acid, such as nitric acid, sulfuric acid or, preferably, hydrochloric acid, in an appropriate aqueous solvent, such as water or, preferably, an ethanol-water mixture to produce a diazonium species which is directly converted to compound (l) in a coupling reaction with an appropriate aryl species in the presence of a base, preferably sodium hydrogen carbonate, or an acid, preferably hydrochloric acid.

Scheme III outline a further procedure for the synthesis of Formula I compounds. A protected hydroxyphenylboronic acid; (m) (Prot = alkyl or substituted alkyl, e.g. methyl, benzyl) such as 5-chloro-2-methoxyphenylboronic acid, 5-fluoro-2-methoxyphenyl, boronic acid or 2-methoxy-5-formylphenylboronic acid, is coupled with a substituted halogenoaryl species, such as 5-(3-bromophenyl)tetrazole or 5-bromonicotinic acid, in the presence of a catalyst, preferably tetrakis(triphenylphosphino) palladium, and a base, such as sodium carbonate or triethylamine in a suitable solvent such as aqueous 1,4-dioxane or dimethylformamide afforded substituted aryl compound (n). Removal of the protecting group Prot is accomplished using an protic or Lewis acid, such as concentrated hydrobromic acid, boron tribromide or trimethylsilyl iodide to afford the phenol (o). Nitration of (o) with nitric acid, or sodium nitrate in the presence of an acid, such as acetic or hydrochloric acid, affords the nitro compound (p). Reduction of the nitro group by catalytic hydrogenation or mediated by a reducing metal such as iron or tin dichloride in a suitable solvent such as ethanol, acetic acid or water gives the aniline (q). Compound (q) is diazotized by reaction with sodium nitrite and an appropriate acid, such as nitric acid, sulfuric acid or, preferably, hydrochloric acid, in an appropriate aqueous solvent, such as water or, preferably, an ethanol-water mixture to produce a diazonium species which is

directly converted to compound (r) in a coupling reaction with an appropriate aryl species in the presence of a base, preferably sodium hydrogen carbonate, or an acid, preferably hydrochloric acid.

Scheme IV outlines the formation of pyrazoles for use in scheme I-III. An amine such as 4-methylaniline, compound (s), is diazotized by the action of sodium nitrite and an appropriate acid, such as hydrochloric acid, nitric acid or sulfuric acid, in an appropriate aqueous solvent system, such as water or ethanol-water mixtures, then reduced *in situ* by tin chloride to afford hydrazine, compound (t). The hydrazine is then condensed with an electrophilic carbonyl species such as ethyl acetoacetate (u), ethyl cyanoacetate or diethyl malonate, in an appropriate solvent such as acetic acid or ethanol at an appropriate temperature typically 0-100° to give the corresponding pyrazole, compound (v) as described herein.

The treatment of thrombocytopenia, as described herein, is accomplished by increasing the production of platelets.

- 25 By the term "co-administering" and derivatives thereof as used herein is meant either simultaneous administration or any manner of separate sequential administration of a TPO mimetic compound, as described herein, and a further active ingredient or ingredients, known to treat thrombocytopenia, including chemotherapy-induced thrombocytopenia and bone marrow transplantation and other conditions with depressed platelet production. The
30 term further active ingredient or ingredients, as used herein, includes any compound or therapeutic agent known to or that demonstrates advantageous properties when administered with TPO or a TPO mimetic. Preferably, if the administration is not simultaneous, the compounds are administered in a close time proximity to each other. Furthermore, it does not matter if the compounds are administered in the same dosage
35 form, e.g. one compound may be administered topically and another compound may be administered orally.

Examples of a further active ingredient or ingredients for use in combination with the presently invented TPO mimetic compounds include but are not limited to: chemoprotective or myeloprotective agents such as G-CSF, BB10010 (Clemons et al., Breast Cancer Res. Treatment, 1999, 57, 127), amifostine (Ethyol) (Fetscher et al., Current Opinion in Hemat., 2000, 7, 255-60), SCF, IL-11, MCP-4, IL-1-beta, AcSDKP (Gaudron et al., Stem Cells, 1999, 17, 100-6), TNF-a, TGF-b, MIP-1a (Egger et al., Bone Marrow Transpl., 1998, 22 (Suppl. 2), 34-35), and other molecules identified as having anti-apoptotic, survival or proliferative properties.

Tpo has been demonstrated to act as a mobilizer of stem cells into the peripheral blood (Neumann T. A. et al., Cytokines, Cell. & Mol. Ther., 2000, 6, 47-56). This activity can synergize with stem cell mobilizers such as G-CSF (Somolo et al., Blood, 1999, 93, 2798-2806). The TPO mimetic compounds of the present invention are thus useful in increasing the numbers of stem cells in circulation in donors prior to leukapheresis for hematopoietic stem-cell transplantation in patients receiving myelo-ablative chemotherapy.

Likewise, TPO stimulates growth of myeloid cells, particularly those of granulocyte/macrophage lineage (Holly et al., US-5989537). Granulocyte/macrophage progenitors are cells of the myeloid lineage that mature as neutrophils, monocytes, basophils and eosinophils. The compounds described in the present invention have thus therapeutic utility in stimulating the proliferation of neutrophils in patients with neutropenic conditions.

Additional examples of a further active ingredient or ingredients for use in combination with the presently invented TPO mimetic compounds include but are not limited to: stem cell, megakaryocyte, neutrophil mobilizers such as chemotherapeutic agents (i.e., cytoxan, etoposide, cisplatin, Ballestrero A. et al., Oncology, 2000, 59, 7-13), chemokines, IL-8, Gro-beta (King, A. G. et al. J. Immun., 2000, 164, 3774-82), receptor agonist or antagonist antibodies, small molecule cytokine or receptor agonists or antagonists, SCF, Flt3 ligand, adhesion molecule inhibitors or antibodies such as: anti-VLA-4 (Kikuta T. et al., Exp. Hemat., 2000, 28, 311-7) or anti-CD44 (Vermeulen M. et al., Blood, 1998, 92, 894-900), cytokine/chemokine/interleukin or receptor agonist or antagonist antibodies, MCP-4 (Berkhout TA., et al., J. Biol. Chem., 1997, 272, 16404-16413; Ugucioni M. et al., J. Exp. Med., 1996, 183, 2379-2384).

Because the pharmaceutically active compounds of the present invention are active as TPO mimetics they exhibit therapeutic utility in treating thrombocytopenia and other conditions with depressed platelet production.

By the term "thrombocytopenia" and derivatives thereof as used herein is to be broadly interpreted as any decrease in the number of blood platelets below what is considered normal or desired for a healthy individual. Thrombocytopenia is known to have

many causative factors, including but not limited to, radiation therapy, chemotherapy, immune therapy, immune thrombocytopenic purpura (ITP, Bussel J. B., Seminars in Hematology, 2000, 37, Suppl 1, 1-49), myelodysplastic syndrom (MDS), aplastic anemia, AML, CML, viral infections (including, but not limited to; HIV, hepatitis C, parvovirus) liver disease, myeloablation, bone marrow transplant, stem cell transplant, peripheral blood stem cell transplant, progenitor cell defect, polymorphisms in stem cells and progenitor cells, defects in Tpo, neutropenia (Sawai, N. J. Leukocyte Biol., 2000, 68, 137-43), dendritic cell mobilization (Kuter D. J. Seminars in Hematology, 2000, 37, Suppl 4, 41-49), proliferation, activation or differentiation. The pharmaceutically active compounds of this invention are useful in treating thrombocytopenia regardless of the factor or factors causing the condition. The pharmaceutically active compounds of this invention are also useful in treating thrombocytopenia when the causative factor or factors of the condition are unknown or have yet to be identified.

Prophylactic use of the compounds of this invention is contemplated whenever a decrease in blood or blood platelets is anticipated. Prophylactic use of the compounds of this invention results in a build up of platelets or a commencement of platelet production prior to an anticipated loss of blood or blood platelets. Prophylactic uses of the compounds of this invention includes but is not limited to transplant surgery, surgery, anesthesia prior to child birth and gut protection.

Human dendritic cells have been shown to express the TPO receptor (Kumamoto et al., Br. J. Haem., 1999, 105, 1025-1033) and TPO is a potent mobilizer of dendritic cells. The TPO mimetic compounds of the current invention are also useful as a vaccine adjuvant in that they increase the activity and mobility of dendritic cells. The pharmaceutically active compounds of this invention are useful as an immunological adjuvant, given in combination with an orally, transdermally or subcutaneously delivered vaccine and/or immunomodulator, by increasing the activity and mobility of dendritic cells.

Tpo is known to have various effects including anti-apoptotic/survival effects on megakaryocytes, platelets and stem cells, and proliferative effects on stem cells and megakaryocytic cells (Kuter D. J. Seminars in Hematology, 2000, 37, 41-9). These Tpo activities effectively increase the number of stem and progenitor cells so that there is synergistic effects when Tpo is used in conjunction with other cytokines that induce differentiation.

The TPO mimetic compounds of the current invention are also useful in acting on cells for survival or proliferation in conjunction with other agents known to act on cells for survival or proliferation. Such other agents include but are not limited to: G-CSF, GM-CSF, TPO, M-CSF, EPO, Gro-beta, IL-11, SCF, FLT3 ligand, LIF, IL-3, IL-6, IL-1, Progenipoinetin, NESF, SD-01, or IL-5 or a biologically active derivative of any of the

aforementioned agents, KT6352 (Shiotsu Y. et al., Exp. Hemat. 1998, 26, 1195-1201), uteroferrin (Laurenz JC., et al. Comp. Biochem. & Phys., Part A. Physiology., 1997, 116, 369-77), FK23 (Hasegawa T., et al. Int. J. Immunopharm., 1996, 18 103-112) and other molecules identified as having anti-apoptotic, survival or proliferative properties for stem cells, progenitor cells, or other cells expressing Tpo Receptors.

In determining potency as TPO mimetics, the following assays were employed:

Luciferase Assay

Compounds of the present invention were tested for potency as mimetics of the TPO receptor in a Luciferase assay such as described in Lamb, et al., Nucleic Acids Research 23: 3283-3289 (1995) and Seidel, et al., Proc. Natl. Acad. Sci. USA 92: 3041-3045 (1995) by substituting a TPO-responsive BaF3 cell line (Vigon et al. Proc. Natl. Acad. Sci. USA 1992, 89, 5640-5644) for the HepG2 cells utilized therein. The murine BaF3 cells express TPO receptors and closely match the pattern of STAT (signal transducers and activators of transcription) activation observed in primary murine and human bone marrow cells.

Proliferation Assay

Some of the more preferred compounds of this invention were active in an in vitro proliferation assay using the human UT7TPO cell line. UT7TPO cells are a human megakaryoblastic cell line that express Tpo-R, whose survival and growth is dependent on the presence of TPO (Komatsu et al. Blood 1996, 87,4552).

Differentiation Assay

Likewise, some of the most preferred compounds of this invention were also positive in stimulating the maturation of megakaryocytes from human bone marrow cells. In this assay, purified human CD34+ progenitor cells were incubated in liquid culture with test compounds for 10 days and the number of cells expressing the transmembrane glycoprotein CD41 (gpIIb), a megakaryocytic marker, was then measured by flow cytometry (see Cwirla, S. E. et al Science, 1997, 276, 1696).

The pharmaceutically active compounds within the scope of this invention are useful as TPO mimetics in mammals, particularly humans, in need thereof.

Some of the preferred compounds within the scope of the invention showed activation from about 4% to 100% control at a concentration of 0.001-10 uM in the luciferase assay. The preferred compounds of the invention also promoted the proliferation of UT7TPO and 32D-mpl cells at a concentration of 0.003 to 30 uM. The preferred compounds of the invention also showed activity in the CD41 megakaryocytic assay at a concentration of 0.003 to 30 uM.

The present invention therefore provides a method of treating thrombocytopenia and other conditions with depressed platelet production, which comprises administering a compound of Formula (I) or a pharmaceutically acceptable salt, hydrate, solvate or ester thereof in a quantity effective to enhance platelet production. The compounds of Formula (I) also provide for a method of treating the above indicated disease states because of their demonstrated ability to act as TPO mimetics. The drug may be administered to a patient in need thereof by any conventional route of administration, including, but not limited to, intravenous, intramuscular, oral, subcutaneous, intradermal, and parenteral.

The pharmaceutically active compounds of the present invention are incorporated into convenient dosage forms such as capsules, tablets, or injectable preparations. Solid or liquid pharmaceutical carriers are employed. Solid carriers include, starch, lactose, calcium sulfate dihydrate, terra alba, sucrose, talc, gelatin, agar, pectin, acacia, magnesium stearate, and stearic acid;. Liquid carriers include syrup, peanut oil, olive oil, saline, and water. Similarly, the carrier or diluent may include any prolonged release material, such as glyceryl monostearate or glyceryl distearate, alone or with a wax. The amount of solid carrier varies widely but, preferably, will be from about 25 mg to about 1 g per dosage unit. When a liquid carrier is used, the preparation will be in the form of a syrup, elixir, emulsion, soft gelatin capsule, sterile injectable liquid such as an ampoule, or an aqueous or nonaqueous liquid suspension.

The pharmaceutical preparations are made following conventional techniques of a pharmaceutical chemist involving mixing, granulating, and compressing, when necessary, for tablet forms, or mixing, filling and dissolving the ingredients, as appropriate, to give the desired oral or parenteral products.

Doses of the presently invented pharmaceutically active compounds in a pharmaceutical dosage unit as described above will be an efficacious, nontoxic quantity preferably selected from the range of 0.001 - 100 mg/kg of active compound, preferably 0.001 - 50 mg/kg. When treating a human patient in need of a TPO mimetic, the selected dose is administered preferably from 1-6 times daily, orally or parenterally. Preferred forms of parenteral administration include topically, rectally, transdermally, by injection and continuously by infusion. Oral dosage units for human administration preferably contain from 0.05 to 3500 mg of active compound. Oral administration, which uses lower dosages is preferred. Parenteral administration, at high dosages, however, also can be used when safe and convenient for the patient.

Optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular TPO mimetic in use, the strength of the preparation, the mode of administration, and the advancement of the disease condition.

Additional factors depending on the particular patient being treated will result in a need to adjust dosages, including patient age, weight, diet, and time of administration.

The method of this invention of inducing TPO mimetic activity in mammals, including humans, comprises administering to a subject in need of such activity an effective
5 TPO mimetic amount of a pharmaceutically active compound of the present invention.

30 Contemplated Equivalents – It will be appreciated by the person of ordinary skill in the art that the compounds of Formulas I and II may also exist in tautomeric forms. For example, in Formula I, the double bond that is drawn between the two nitrogen atoms exists between the lower nitrogen atom and the AR substituent.
